

♥️ JavaScript Learning Journey Continues!

Today I learned about **Destructuring** — a modern and clean way to extract values from arrays and objects.

It makes code shorter, readable, and easier to manage. ✨

🌀 Focus of the Day:

- Array destructuring
- Object destructuring
- Renaming variables during destructuring
- Default values to avoid undefined
- Nested destructuring
- Destructuring inside functions

🔍 What I Learned:

- Destructuring removes repetitive code
- Easily extract values like:
`const { name, age } = user`
- Quick swapping using array destructuring
- Works perfectly for API data and complex objects

💬 Reflection:

✅ Day 23 completed!

Destructuring instantly made my code cleaner and more professional.

This feature is widely used in real-world JS projects — especially React, Node.js, and API responses.

🎯 Next Target (Day 24):

➡️ Learn **Spread & Rest Operators** — more tools to handle arrays, objects, and function parameters easily.
