⊞ Day 24 of 60 | #100DaysOfCode Challenge 💻

🎗 JavaScript Learning Journey Continues!

Today I explored the **Spread and Rest Operators** — two powerful features in modern JavaScript that make working with arrays, objects, and function parameters much easier and cleaner. 🚀

🧩 Focus of the Day:

- Using spread (...) to copy arrays & objects
- Merging multiple arrays into one
- Cloning objects without reference issues
- Converting NodeLists/strings into arrays
- Using rest (...) to handle unlimited function arguments
- Combining both for flexible code

🔍 What I Learned:

- Spread operator is perfect for expanding arrays and objects
- Rest operator helps collect values into arrays inside functions
- These tools remove the need for loops in many cases
- Used in React props, Node.js APIs, array merging, and more

💬 Reflection:
☑ Day 24 completed!
These operators make JavaScript feel modern and super clean.
Now I can merge, copy, and pass data in a far more elegant way!

🎯 Next Target (Day 25):
➡ Build a **Mini Project: Student Record Manager** using all the concepts learned so far.
